

PRODUCT SHEET: PERIMETER STRIP

Resilient Strip

PERIMETER is a resilient strip used to minimize sound transmissions between isolated structures and non-isolated structures. It limits flanking noise transmissions between floating floors or suspended ceilings and adjacent walls or between acoustically decoupled party walls and the building structure.

SYSTEM FEATURES:

- » Can be applied around floating floors, suspended ceilings and isolating party walls
- » Eliminates the risk of flanking transmission at the floor/wall/ceiling perimeter by completely isolating the hard surfaces
- » Long term performance
- » Width of the perimeter strip can be adapted to the project

REQUIREMENTS:

To choose the type of PERIMETER resilient strip, our engineers will need to know:

- » Type of decoupled structure (floor, ceiling, wall)
- » Dimensions of the PERIMETER strip
